Stratégies de lutte intégrée contre les ravageurs du maïs: mise en pratique en Italie

LORENZO FURLAN
Settore Ricerca Agraria
lorenzo.furlan@venetoagricoltura.org
PROFILACTIC USE OF NEONICOTINOIDS AT MAIZE SOWING HAD AN IMPORTANT ROLE TO CAUSE HONEY BEE LOSSES CASES
PROFILACTIC USE OF INSECTICIDES IS STRONGLY AGAINST IPM PRINCIPLES THAT HAVE BECOME COMPULSORY SINCE THE FIRST OF JANUARY 2014 BASED ON DIRECTIVE 2009/128/CE
1) Treatment may be applied only once pest population levels have been estimated by means of monitoring and development models;

2) Treatment may then be carried out only where and when monitoring has found that levels are above set economic thresholds;

3) If economic thresholds are exceeded, agronomic solutions, mainly rotation, should be considered to avoid damage to maize crops;

4) If economic thresholds are exceeded and no agronomic solutions are available, biological control or physical treatment, or any other non-chemical pest control method, should be considered as a replacement for chemical treatment.
1) WHAT IS THE RISK LEVEL? ARE POPULATIONS LEVELS ABOVE THRESHOLDS EVERYWHERE AND THEN TREATMENTS NEEDED ON ALL FIELDS OR ON FEW OF THEM?

2) ARE IPM STRATEGIES (MONITORING METHODS, RISK ASSESSMENT, TRESHOLDS FOR KEY PESTS, AGRONOMIC AND/OR BIOLOGICAL ALTERNATIVES) AVAILABLE?
MAIN PESTS

1. SOIL PESTS, SPECIES HARMFUL AT EARLY MAIZE STAGES

2. PESTS HARMFUL TO DEVELOPED MAIZE (ECB, HELICOVERPA, ……) NEXT CONFERENCE!!
1. PESTS AT EARLY STAGES

INSECTS AND OTHER ARTHROPODS

VIRUSES TRANSMITTED BY INSECTS

OTHER ANIMALS

Neonics effective but diseases have low incidence, hybrids are usually resistant – resistant hybrids as effective as neonicotinoids

Other solutions
1. PESTS AT EARLY STAGES: insects and other arthropods

A. BLACKCUTWORMS
B. (WCR) DIABROTICA
C. WIREWORMS

D. OTHER SOIL PESTS, e.g. diplopods, ...
( low incidence in Italy and France)
A. BLACKCUTWORMS (A. ipsilon)

- OCCASIONAL ATTACKS (last significant outbreaks 1971, 1983)
- LOW ECONOMIC DAMAGE
- ATTACKS NOT PREDICTABLE at sowing
- NEGLIGIBLE CONTROL BY SOIL INSECTICIDES (ALSO AS SEED COATING) WHEN NEEDED
- ALERT PROGRAMME PREDICTS WHERE AND WHEN POST-EMERGENCE TREATMENTS ARE NEEDED

UNJUSTIFIED AT SOWING TREATMENTS
A. BLACKCUTWORMS - IPM

BLACKCUTWOM ALERT PROGRAM
(evaluation of southern winds, assessment of moth arrival with pheromone traps, prediction of formation of harfmul instars by a development model)

BULLETIN TO INFORM ABOUT POPULATION DEVELOPMENT

POSSIBLE FOLIAR TREATMENTS WHEN FOURTH INSTAR FORMS AND WE HAVE AN EARLY ATTACK ABOVE THRESHOLD (5% OF DAMAGED PLANTS)
A. BLACKCUTWORMS
KEY QUESTION: IS IT POSSIBLE IPM?

1) WHAT IS THE RISK LEVEL? LOW, < 1%

2) ARE IPM STRATEGIES (MONITORING METHODS, RISK ASSESSMENT, TRESHOLDS FOR KEY PESTS) AVAILABLE? YES, BLACKCUTWORM ALERT PROGRAMME RUNNING SINCE 1991 IN ITALY WITH HIGH PRECISION
B. WCR - DIABROTICA

• POPULATIONS BELOW ECONOMIC THRESHOLD IN MOST OF THE EUROPEAN MAIZE FIELDS

• ROTATION THE ONLY FULL EFFECTIVE STRATEGY (provisions of directive 128/2009/CE give solution)

• ROTATION MAY BE EFFECTIVE EVEN AS “SOFT” MODALITY (1 YEAR OUT OF 2 OR MORE YEARS IF IMPLEMENTED AT LARGE SCALE

• AVAILABLE SOLUTIONS FOR ROTATION THAT DO NOT REDUCE GROSS MARGIN OF LIVESTOCK/BIOGAS FARMS

• TREATMENTS AT SOWING DO NOT SIGNIFICANTLY AFFECT WCR POPULATION DYNAMICS

• POSSIBILITY OF INSECTICIDE FAILURE WHEN POPULATIONS ARE REALLY HIGH

> CASES UNJUSTIFIED AT SOWING TREATMENTS
THRESHOLD  6 beetles/trap/day over a 3 – 6 week period
B. WCR - diabrotica
KEY QUESTION: IS IT POSSIBLE IPM?

1) WHAT IS THE RISK LEVEL?  LOW

2) ARE IPM STRATEGIES (MONITORING METHODS, RISK ASSESSMENT, TRESHOLDS FOR KEY PESTS, AGRONOMIC (first of all rotation) – NON CHEMICAL SOLUTIONS,…..) AVAILABLE?

It can be kept below economic threshold by rotation - rotation is the first option for IPM based on directive 2009/128/CE IPM OF DIABROTICA ONLY MEANS THE IMPLEMENTATION OF RATIONAL ROTATION WITHOUT ANY CHEMICAL TREATMENTS (AT SOWING OR LATER AGAINST BEETLES)
B. WCR - DIABROTICA

Assessments 2012-2013 in areas with high WCR populations Vicenza and Treviso provinces in Veneto (North East Italy)
1= maize just after 1 year of continuous maize interruption
2= second year of maize after 1 year interruption and so on

years of continuous maize

ROOT DAMAGE – IOWA SCALE 0 -3

IOWA ROOT DAMAGE RATE

0,094
0,135
0,094
0,085
0,733

1 2 3 4.5 > 5
B. WCR - DIABROTICA 
IPM ACCORDING DIRECTIVE 
2009/128/CE

1) Treatment may be applied only once pest population levels have been estimated by means of monitoring and development models; AVAILABLE

2) Treatment may then be carried out only where and when monitoring has found that levels are above set economic thresholds; AVAILABLE

3) If economic thresholds are exceeded, agronomic solutions, mainly rotation (the only fully effective, low impact strategy), should be considered to avoid damage to maize crops; AVAILABLE

4) If economic thresholds are exceeded and no agronomic solutions are available, biological control also AVAILABLE (nematodes) or physical treatment, or any other non-chemical pest control method, should be considered as a replacement for chemical treatment.
1) WHAT IS THE RISK LEVEL?  LOW

2) ARE IPM STRATEGIES (MONITORING METHODS, RISK ASSESSMENT, TRESHOLDS FOR KEY PESTS, AGRONOMIC (first of all rotation) – NON CHEMICAL SOLUTIONS,…..) AVAILABLE?

It can be kept below economic threshold by “soft” rotation - rotation is the first option for IPM based on directive 2009/128/CE IPM OF DIABROTICA ONLY MEANS THE IMPLEMENTATION OF RATIONAL ROTATION WITHOUT ANY CHEMICAL TREATMENTS (AT SOWING OR LATER AGAINST BEETLES)
C. WIREWORMS

THE ITALIAN CASE

DAMAGED FIELDS BY WIREWORMS (over 30 years observations in Italy)

• visible damage (plants with attack symptoms easily found, more than 5% of damaged plants): < 5,0 %

• high damage (>30% of damaged plants): < 1,0 %

• sure economic damage (significant yield reduction) < 0,1 %
### C. WIREWORMS (Apenet 2010 – a big survey in Po Valley)

C. WIREWORMS

WHAT ABOUT THE OTHER MEMBER STATES?

PURE PROJECT (SEVENTH FRAMEWORK PROGRAMME)
2011 - 2012

• 3 on-stations experiments - FRANCE, HUNGARY, ITALY (long-term) to investigate different

• 15 on farm experiments (FRANCE, GERMANY, HUNGARY, ITALY, SLOVENIA)
The experiments (15) were carried out at:
1) Southern climatic conditions – Italy (5 locations) and France (2 locations)
2) Central climatic conditions – Germany (2 locations)
3) Eastern climatic conditions – Hungary (4 locations) and Slovenia (2 locations)

• On-farm experiments were managed with commercially available equipment

31 experiments in 2 years
Whole untreated fields/plots or alternated treated/untreated strips
NO ECONOMIC WIREWORM DAMAGE!!!!!!!
AVAILABLE TOOLS FOR IPM

A) RISK FACTORS
B) PHEROMONE TRAPS
C) BAIT TRAPS
D) AGRONOMIC STRATEGIES
E) BIOCIDAL PLANTS AND MEALS
F) OTHER BIOLOGICAL TREATMENTS

PLANTING CROPS WHERE AND WHEN THERE IS NO SERIOUS ECONOMIC DAMAGE RISK
AREA-WIDE LEVEL

A) AGRONOMIC RISK FACTORS

1. CONTINUOUS PLANT COVER (meadow, double crops as rye grass-maize, oilseed rape-soybean,…);

2. PEAT SOILS (high organic matter content)

3. PREVIOUS DAMAGE

4. (high beetle captures with Yf and/or high incidence of uncultivated zones like grasses, forest,….

5. IRRIGATION (continuous supply of water keeping high soil moisture)
AREA-WIDE LEVEL

B) PHEROMONE TRAPS

- RELIABLE (NON SATURABLE)
- FEW INSPECTIONS
- EASY, QUICK MANAGEMENT
- LOW COSTS
- MULTIBAITED (MORE SPECIES MONITORED AT THE SAME TIME BY ONE TRAP)
C) BAIT TRAPS FOR COMPLEMENTARY LIMITED IN FIELD EVALUATION

a) IF AND WHERE THERE IS A POPULATION RISK OF ECONOMIC POPULATIONS PLACING BAIT TRAPS

b) EVALUATION OF LARVAL THRESHOLDS

BEFORE THE “BEES CASE”
• Different soils and rotations
• Different sowing timing
• Different seed densities and inter-row (75 cm - 45 cm)
• Typical cultivation techniques
• low wireworm population fields: 40 - 60%

• medium wireworm population fields: 30 - 50%

• high wireworm population fields: 10 - 15%
• large plots 300 – 1500 m² (m³ – 4.5 X ..) randomized blocks
• 2-8 replications

• Assessments

• stand at emergence
• damaged seedlings and plants
• stand at 4-6 leaves
damaged plants st. 4-8 leaves
• plants damaged by other pests (aphids, viruses,..)
• yield
1) NAKED Seeds – untreated: no insecticide or fungicide as seed treatments;
2) FUNGICIDE: Metalaxil+fludioxonil (Celest®), a fungicide, at the rate of 100 ml/q of seed;
3) Imidacloprid (Gaucho®), an insecticide: at the rate of 1,2 mg a.i./seed;
4) Fipronil (Regent® TS), an insecticide: at the rate of 0,6 mg a.i./seed;
5) Thiametoxam (Cruiser®), an insecticide: at the rate of 0,63 or 1,25 mg a.i./seed;
6) Thiametoxam+tefluthrin rate (Powered by Cruiser & Force), both insecticides: thiametoxam at the rate of 1,00 mg a.i./seed + tefluthrin at the rate of 0,4 mg a.i./seed;
7) Clothiadinin (Poncho®), an insecticide at the rate of 1,25 mg a.i./seed.

Lorenzo Furlan – Agricultural Research Department
Maize sowing: what to do?

Risk factors presence

Risk factors
- Previous years: continuous plant cover of meadow or double crops (such as meadow, barley and soybean, ryegrass and maize, etc.)
- More than 5% organic matter content of the soil, ...

Other risk factors

Meadow

Bait traps (larvae)

Spring ploughing (before sowing)

> threshold

< threshold

Maize anyway

Move the crop to uninfested field

Treatment (biological or chemical)

No treatment (> 90%)

No risk factors
C. WIREWORMS

KEY QUESTION: IS IT POSSIBLE IPM?

1) WHAT IS THE RISK LEVEL? LOW

2) ARE IPM STRATEGIES (MONITORING METHODS, RISK ASSESSMENT, TRESHOLDS FOR KEY PESTS, AGRONOMIC (first of all rotation) – NON CHEMICAL SOLUTIONS,…..) AVAILABLE?

Yes, and MUTUAL FUNDS may allow a rapid implementation of IPM
A NEW “INSURANCE” APPROACH

MUTUAL FUNDS INSTEAD OF INSECTICIDES TREATMENTS

IF THE RISK IS LOW THE INSURANCE APPROACH IS CONVENIENT AND MUCH SAFER FOR PEOPLE ENVIRONMENT (INCLUDING BEES)
## RISKS COVERED
- Insufficient plant density (stand) because of adverse climatic conditions (namely drought, flooding, freezing cold)
- Insufficient plant density (stand) because of soil pests (such as wireworms, blackcutworms,...) or diseases such as Fusarium spp. (rotten roots, seedlings)

## TARGET
Members of farmer sconsortium

## OBLIGATIONS
- Contract to be signed before sowing;
- Implementation of good cultivation practices;
- Connection and implementation of suggestions of Bullettin of Arablecrops’’

## COSTS
25€/ha all inclusive (including flooding (rain excess,) freezing cold, drought); pest risk alone is covered with less than 15 €/ha

## COMPENSATIONS
UP TO 700€ /ha including:
- Resowing (up to 200€/ha) if stand below 4 pls/m²
- Yield reduction (up to 500€/ha) based on sowing delay, crop change, ...

## COMPENSATION LIMITS
According to farm size:
- Up to 10 ha limit 2.000€;
- Between 11 and 20 ha: 4.000 €
- >20 ha: 10 times total cost or 50.000 €
1) Reduction of costs/ha;

2) Coverage of risks due to mistakes or difficulties in IPM implementation (e.g. delay in blackcutworm treatments);

3) Coverage of other risks such as flooding, drought not covered by insecticides;

4) Reduction of health risk for farmers since they will not get in touch with insecticides at all;

5) Avoidance of negative impact of insecticides on soil beneficials;

6) Avoidance of pollution risks for soils and water tables;
7) Avoidance of risks for bees and other wild pollinators; more generally reduction of risks for fauna;

8) Risk coverage with any climatic conditions while soil insecticides may fail (Furlan et al. 2011, Ferro e Furlan, 2012, Furlan et al. 2014)

IPM IN MAIZE

IPM IS THE MOST POWERFUL TOOL TO REDUCE RISKS FOR BEES, HUMAN AND ENVIRONMENTAL IMPACT OF MAIZE CULTIVATION ALSO IMPROVING FARMERS INCOMES
INSECTICIDE TREATMENTS ON < 10% OF MAIZE FIELDS BY MEANS OF IMMEDIATE IPM IMPLEMENTATION

NO RISK FACTORS: NO TREATMENTS AT ALL - MUTUAL FUNDS to support first IPM phases or long term IPM implementation as well

PRESENCE OF RISK FACTORS : TREATMENTS where populations above economic thresholds are present - MUTUAL FUNDS to cover risk of IPM implementation mistakes, mainly in the first phase
1) SUPPORT INDEPENDENT ADVISORY SYSTEM

2) GIVE CONTRIBUTIONS AND TECHNICAL SUPPORT TO MUTUAL FUNDS IN ORDER TO COVER IPM RISK

3) SUPPORT APPLIED RESEARCH FOR PRACTICAL SOLUTIONS AND INNOVATION DISSEMINATION
Az. Moizzi Luciana, Eraclea (VE)

Cultivated land ha 145
Reclaimed soil (1920, below sea level)
Silty loam soil, 2-3% organic matter

Conventional tillage
Rotation: winter wheat, maize, soybean
(small surface with sugar-beet, 10-15 ha, same fields every 10-12 years)
Az. Moizzi Luciana, Eraclea (VE)  
Monitoring from 1984 to 2014 each year  
Soil sampling first years  
bait traps (larvae) from 1992  
PHEROMONE TRAPS traps (adults) from 1996
SOME SUCCESSFUL CASE STUDIES
Moizzi Italy RESULTS

A. brevis: negligible populations

A. litigiosus: negligible populations

A. sordidus: low populations (beetles < 300; larvae 0 to 0,2/tr)

A. ustulatus: (10% of the surface with high beetle population > 1500 beetles/season); wireworm density above threshold in 3 years, totally 9 ha)
SOME SUCCESSFUL CASE STUDIES
Moizzi Italy RESULTS

1. More 1500 maize hectares untreated (no soil insecticide use) 1984 - 2014

2. 9/1500 (0,60%) with economic populations (solution – replacement of maize with other crop)

3. Seed + plant damage always lower 5% (0,1 to 2,5% usually)

4. NO ECONOMIC DAMAGE: 96% fields high stand (> 90% of sown seeds)/Some cases of stand reduction (anyway > 5 pp/m²) mainly because of bird damage

5. > 55.000 € saved, no threat to worker health, no environmental impact

HOW TO REACH FARMERS
“BULLETIN OF ARABLE CROPS”
flexibility, the cadence on average is at least weekly, but it varies according to the needs, since it is closely related to the evolution of crops and pests; the information is forwarded by e-mail and always available on the web-site (http://www.venetoagricoltura.org), while, in case of immediate risk, the alert is given also via SMS;

- **preparation**: it gives a continuous information on how to react promptly and properly in case of alert message;

- **formation**: bulletins are designed in a way to provide in-depth information (e.g recognition of symptoms, pests);

- **participation**: the farmers can use monitoring tools;

- **interaction**: possibility to ask questions and to propose changes
